

Transplanting Seedlings

Seedling mangement

A farmer should transplant when second set of true leaves come up and new pots used should be 3 times the volume of old ones. When buying soil mix to transplant seedlings, get specific container mix and for own soil mix, mix 50% coconut fibre with 50% compost and add perlite, vermiculite and fill mix into pots and level them and compress them down slightly.

Additionally, presoak soil for 2 hours to determine transplanting success and make holes in pots and plant on a depth according to plant.

Finally, provide enough light to seedlings/ transplants.
